

# ***GAMA 78***

GAMA

- Visos gamybai naudojamos medžiagos yra sertifikuotos ir atitinka joms keliamus reikalavimus.
- GAMA 78 tipo langai gaminami iš pušies, ažuolo, maumedžio, šorėjos (meranti) medienos.
- Medienos ruošiniai yra klijuoti tašai, todėl mažiau traukiasi ir plečiasi. Pušies medienos ruošiniai gali būti dygiuoti arba nedygiuoti.
- Medienos ruošinių drėgnumas atitinka LST1514:1998 reikalavimus ir yra 12%.
- Lango rėmas gali būti lakuojamas arba dažomas, tam naudojama suomių firmos Teknos dažai ir lakas.
- Į 78 mm staktos pločio langą galima įdėti 24-44 mm storio stiklo paketus. Populiariausi yra dviejų kamerų stiklo paketai su selektyvine danga vidinėje ir išorinėje stiklo pusėje.
- Selektvinė danga - tai metalo dulkių danga, kuri atspindi pro stiklo paketą judančią šilumą.
- Paketų tarpai tarp stiklų dažniausiai užpildomi argono dujomis. Dar gali būti naudojamos ksenono arba kriptono dujos, jų šilumos izoliavimo rodikliai dar geresni.
- Stiklo paketo rėmelis gali būti iš aliuminio arba plastiko (plastikinio rėmelio šilumos izoliavimo rodikliai yra geresni).
- Langai turi būti sumontuoti pagal statybos taisykles - ST 2491109.01.2000 "Langų, durų ir jų konstrukcijų montavimas"
